

Eigen::internal::traits< T >

Eigen::internal::traits< T >

Eigen::internal::traits< const T >

```
graph BT; A[Eigen::internal::traits< const T >] --> B[Eigen::internal::traits< T >]; A --> C[Eigen::internal::traits< T >];
```

The diagram illustrates the inheritance of the `Eigen::internal::traits` template class. A box at the bottom, labeled `Eigen::internal::traits< const T >`, has two arrows pointing upwards to two boxes at the top, both labeled `Eigen::internal::traits< T >`. This indicates that the traits for a const-qualified type are inherited from the traits of the non-const type.
