

Eigen::internal::blas_traits< NestedXpr >

Eigen::internal::blas_traits< NestedXpr >

Eigen::internal::blas_traits< Transpose< NestedXpr > >

```
graph BT; A[Eigen::internal::blas_traits< Transpose< NestedXpr > >] --> B[Eigen::internal::blas_traits< NestedXpr >]; A --> C[Eigen::internal::blas_traits< NestedXpr >];
```

The diagram illustrates the inheritance of the `Eigen::internal::blas_traits` template. A central box at the bottom, `Eigen::internal::blas_traits< Transpose< NestedXpr > >`, has two arrows pointing upwards to two identical boxes at the top, both labeled `Eigen::internal::blas_traits< NestedXpr >`. This indicates that the traits for a transposed nested expression are derived from the traits of the nested expression itself.
